

Real-Time Order Tracking - Event-Driven Target Architecture

Week 1 design with explicit seams for RabbitMQ (W3), Outbox/Inbox (W4), Vault (W5), and blue/green deployment (W6)

Correctness and recovery contract. Stable event ID, message ID, order ID, correlation ID, schema version, and per-order sequence connect every boundary. SQL remains authoritative. Outbox prevents accepted-event loss; Inbox/deduplication prevents duplicate state transitions. Clients reconnect with their last sequence and refresh a snapshot before resuming. Expand/contract migrations keep blue and green versions compatible, and runtime credentials move to Vault without changing application contracts.
